

2F PHP-Nuke Performance Report

Untersuchung der Performance unterschiedlicher PHP-Nuke Systeme

Einleitende Bemerkungen

Als Testwerkzeug wurde das ebenso einfache wie nützliche Programm „apache benchmark“ verwendet. Ich habe einmal 10 und einmal 25 Request's genutzt, bei steigender Client-Zahl. Die verschiedenen Testreihen sind entsprechend benannt.

Informationen dazu: <http://httpd.apache.org/docs-2.0/programs/ab.html>
„Apache Benchmark“ wird mit jedem Apache Server mitgeliefert, es eignet sich als kleines Einstiegswerkzeug. Natürlich: Ausgelegt auf die Messung der Leistung des Apache, doch lässt es sich nutzen, um Rückschlüsse auf die Skripte zu ziehen, sofern die Testumgebung nicht verändert wird.

Werbung

Natürlich konnte ich es mir nicht nehmen lassen, neben den Nuke-Systemen auch mein 2F VKP zu testen. Ich habe keine Testreihe zu konkurrierenden VKP oder Nuke-Clones gemacht bzw. habe dies vor. Man möge mir nachsehen, dass ich hier auch zweimal 2F VKP Werte mit aufgenommen habe – schließlich werden sich auch meine Nutzer für die Werte interessieren.

Vergleiche

Im Test habe ich einen Apache 2.0.49 mit mysql 4.1 und PHP 4.3.7 verwendet. Der Apache war nicht optimiert, ich habe bewusst die Standardwerte belassen. Ebenso ist kein Cache-System eingebunden, daher können manche Werte erschreckend hoch sein.

Dieser Report soll keine Aussagen zur absoluten Geschwindigkeit einer bestimmten PHP-Nuke Version treffen – die Geschwindigkeit ist von der Server-Hardware, Konfiguration des Servers, der mySQL Version und evt. vorhandenen Cache-Systemen abhängig. Es geht alleine darum, einen relativen Vergleich zwischen den verschiedenen Versionen herstellen zu können und vielleicht anzuregen, sich weiter mit dem Thema zu beschäftigen.

Ich werde diesen Report regelmäßig fortführen und erweitern bzw. aktualisieren. Die aktuelle Version werde ich auf der www.2f-cms.com Homepage zur Verfügung stellen. Auf jeden Fall werde ich einige besondere Szenarien noch mit aufnehmen und untersuchen.

Testansicht

Im Folgenden kurz ein Test mit Erläuterungen zur erzeugten Statistik:

```
Server Software: Apache/2.0.49
Server Hostname: localhost
Server Port: 80

Document Path: /2fvkp/index.php
Document Length: 3718 bytes

Concurrency Level: 10
Time taken for tests: 28.370795 seconds
Complete requests: 500
Failed requests: 0
Write errors: 0
Total transferred: 2140000 bytes
HTML transferred: 1859000 bytes
Requests per second: 17.62 [# /sec] (mean)
Time per request: 567.416 [ms] (mean)
Time per request: 56.742 [ms] (mean, across all concurrent requests)
Transfer rate: 73.63 [Kbytes/sec] received

Connection Times (ms)
      min mean[+/-sd] median max
Connect:  0  0  1.1  0  10
Processing: 70 563 187.0  620  961
Waiting:  70 562 186.7  620  961
Total:    70 563 187.0  620  961

Percentage of the requests served within a certain time (ms)
50%  620
66%  670
75%  701
80%  721
90%  781
95%  811
98%  891
99%  921
100% 961 (longest request)
```

Die obersten 5 Zeilen beinhalten statistische Werte: Was für ein Server, Adresse, Port, genaue Seitenangabe und Dokumenten-Größe. Der Concurrency-Level beschreibt, wie viele Zugriffe zeitgleich simuliert werden, gefolgt von der genauen Zeitangabe in Sekunden, wie lange der gesamte Test benötigte. Die „complete Requests“ sind die insgesamt ausgeführten Zugriffe, gefolgt von den Fehlern. Dabei sind „failed Requests“ besonders interessant, hierbei handelt es sich um Zugriffe die einfach nicht mehr durchgingen. Mittels „transferred“ wird angegeben, wie viele Daten insgesamt transportiert wurden und wie viel davon HTML Code war. (Hinweis: Header etwa benötigen zusätzlichen Traffic).

Darunter kommen die ganzen statistischen Werte, etwa wie viele Zugriffe pro Sekunde möglich waren, wie viel Zeit jeder Zugriff im Einzelnen benötigt und wie viele Daten pro Sekunde transportiert werden konnten. Gefolgt von einer Übersicht, nach wie viel Zeit wie viele Zugriff prozentual abgearbeitet worden sind.

Datenbankzugriffe

Im Folgenden nun als erstes eine Übersicht über die Zahl der ausgeführten Datenbankzugriffe, je nach PHP-Nuke Version. Es geht hier nur um die Zugriffe auf ausgewählten Seiten - in den Standard-Installationen befinden sich etwa keine Artikel auf der Startseite, so dass es sich hier um teilweise stark geschönte Werte handelt. Insbesondere je nach Modul oder im Adminbereich explodieren die Werte geradezu. Im 2F VKP spielt es keine Rolle, wie viele Artikel auf der Startseite stehen, da das Caching den Großteil abfängt.

Am Ende dieses Dokumentes stelle ich noch mal zwei ausgewählte Szenarien, jeweils zur 5.5 und 7.4 im Detail vor, damit man diese Unterschiede auch wirklich sieht.

Seite : *Index.php (als Admin)*

Zugriff / Version	2F VKP	5.5	6.0	6.5¹	7.4
_query	14 (17)	66 (97)	61 (118)	61 (118)	62 (115)
_fetch_array	27 (29)	1 (3)	1 (1)	0 (0)	0
_fetch_row	12 (13)	82 (112)	76 (134)	100 (158)	95 (147)

Seite : *admin.php (Als Admin eingeloggt)*

Zugriff / Version	2F VKP	5.5	6.0	6.5	7.4
_query	18	66	91	91	88
_fetch_array	8	4	2	0	0
_fetch_row	31	94	120	123	112

Seite : *admin.php (Blöcke verwalten)*

Zugriff / Version	2F VKP²	5.5	6.0	6.5	7.4
_query	40	109	138	138	131
_fetch_array	55	30	30	28	0
_fetch_row	23	158	186	162	174

Seite : *admin.php (Module verwalten)*

Zugriff / Version	2F VKP³	5.5	6.0	6.5	7.4
_query	14	85	135	111	105
_fetch_array	27	4	2	0	0
_fetch_row	59	162	193	195	175

¹ Hinweis: Ab 6.5 leicht verwischte Daten, da eine neue SQL Layer dazu gekommen ist. Hier arbeitet _fetchrow als mysql_query. Die Zahlen stimmen dennoch

² Bisher nur wenig optimiert!

³ Bisher nur wenig optimiert!

Zusammenfassung der Benchmarks

Ich weiß, ungewöhnlich, doch es erfolgt zuerst die Zusammenfassung und die Detail-Briefings stehen dann auf den folgenden Seiten.

Auffällig ist: Am schnellsten ist die Version 5.5 – mit deutlichem Abstand. Überraschend ist die Entwicklung bei den Versionen 7.3 und 7.4, erstmals ist der Zeitverbrauch wieder rückläufig – auch ein Blick in die Tabelle mit den benötigten Datenbank-Zugriffen überrascht, offensichtlich wird wieder am Code gearbeitet.

Es bleibt weiterhin zu raten, auf die 5.5 zu setzen – Sie ist de Facto schneller und hat keinerlei Ausfälle bei den Abfragen. Übrigens kann auch die 6.0 mit fehlerfreier Lieferung aufwarten, danach gibt es in jeder Version fehlerhafte Anfragen. Erschreckend ist die Verzögerung bei der Seitenlieferung in Abhängigkeit der zugreifenden User. Sicherlich ist es normal, dass mit mehr Zugriffen auch die Serverlast steigt, doch ein Blick in die Version 7.4 zeigt, dass bei 1000/10 noch etwa über 1000ms als longest Request benötigt werden, bei 1000/25 explodiert es bereits auf über 3000ms – entsprechend wird die Kurve bei mehr gleichzeitigen Zugriffen steiler, bedingt durch die schlechte Umsetzung der Datenbank-Abfragen.

Insgesamt bleibt festzuhalten, dass mit Hinsicht auf möglichst viele gleichzeitige Zugriffe –wie bei größeren Seiten zu erwarten- wirklich Böses zu erwarten ist. Jeder sollte sich, soweit möglich, einen Cache installieren. Mit dem Turck MMCache steht ein freier, kostenloser Cache zur Verfügung. Wer einen eigenen Server hat: Informieren und installieren – sofort. Auf Netz-ID habe ich einen Artikel dazu geschrieben, sollten auch unerfahrene Webmaster in 15 Minuten problemlos schaffen: <http://www.netz-id.de/artikel1789.html>

Ein Hinweis für diejenigen, die meinen, sie haben ohnehin nur 10 Besucher täglich und man sei nicht betroffen: Man sollte nicht vergessen, dass gerade Suchmaschinen – man denke an den Google-Dance – recht viele gleichzeitige Besucher verursachen können. Ein festgefressener Bot sollte kein Grund sein, dass die Seite plötzlich down ist.

Geschwindigkeits-Benchmarks PHP-Nuke 5.5
